

TalentIQ

AI-assisted candidate capture and recruiter-verified review for high-volume career fairs.

Career fairs move fast. Candidate information is often captured through resumes, notes, memory, or disconnected systems, making quick follow-up harder than it should be.

TalentIQ is a proposed AI-assisted platform that:

- Standardizes short career-fair conversations into consistent candidate records.
- Combines candidate intake, recruiter observations, and AI-supported summarization.
- Supports faster post-event review, follow-up, and interview decisions.

What the MVP needs to prove

A lightweight, end-to-end prototype that captures consistent information and supports recruiter-approved follow-up.

1. Candidate intake

QR-accessible, mobile-friendly intake with only the essential required fields.

2. Recruiter capture

Fast prompts, tags, and short notes for a three-to-five-minute conversation.

3. AI draft summary

Concise snapshot grounded only in supplied information, with missing-data flags.

4. Human verification

Recruiters edit, approve, or reject the AI draft before the summary becomes part of the record.

5. Review dashboard

Search, filters, side-by-side comparison, status assignment, and export.

6. Measurement

Compare manual and RecruitIQ-supported process outcomes using a controlled study.

Design guardrail: AI organizes information and supports decision making. Recruiter's own decisions.

How success will be measured

The capstone should demonstrate a working prototype, responsible AI controls, accessibility evidence, and measurable process improvement.

Workflow completion

Candidate check-in through recruiter-approved follow-up status.

Traceable summaries

AI-generated statements link back to resume, candidate, or recruiter-provided information.

Process improvement

Reduce review effort or improve record completeness and consistency versus the manual process.

Responsible use

No scoring, ranking, protected-trait inference, or unsupported conclusions.

Evaluation focus

Capture time, review time, completeness, consistency, summary accuracy, efficiency gain, usability, and accessibility.

Additional Details

Tech Stack

The team may select the technology stack, AI model, database, and hosting approach most appropriate for the project objectives.
